

Sodium carboxymethyl cellulose side effects

Detail Introduction :

Sodium carboxymethyl cellulose is a commonly used biopolymer compound, which is often used in the production of medicine, cosmetics, food, daily chemicals, etc. However, despite its stable nature and safety, there are still some side effects that need to be paid attention to during use. Let's take a look at the side effects of carboxymethyl cellulose sodium.

1. Allergic reactions: Carboxymethylcellulose sodium is a polymer material, so some people may have allergic reactions to it. If you experience symptoms such as skin itching, redness, rash, etc. after using this substance, you should stop using it immediately and consult your doctor for advice.
2. Eye discomfort: If sodium carboxymethylcellulose accidentally enters the eyes, it may cause eye discomfort such as pain, tingling, redness and swelling of the eyes, etc. If the discomfort symptoms last for a long time, you should seek medical treatment in time to avoid seriously affecting eye health.
3. Gastrointestinal discomfort: Sodium carboxymethylcellulose is an oral drug, which may cause gastrointestinal symptoms in some cases. Such as dry mouth, loss of appetite, nausea and vomiting. If the above symptoms appear, it is recommended to suspend the use of the drug and consult a doctor for further treatment.
4. Affecting the efficacy of drugs: Although sodium carboxymethyl cellulose is a biopolymer compound, it still affects the efficacy of some drugs. For example, when sodium carboxymethylcellulose is used together with some antibiotics, it may reduce the effectiveness of the antibiotics. Therefore, when using sodium carboxymethyl cellulose, attention should be paid to the combined use of drugs, and drugs should be used with caution.

The above are the side effects of sodium carboxymethyl cellulose. I hope that the side effects of sodium carboxymethyl cellulose can be helpful to you. The above content can be viewed when necessary.
